1.0 Overview

Users are encouraged to read *MSA Hardware User Manual* before continuing with this document.

1.1 About The MSA

The MSA is a multipurpose MIDI decoder. It can activate its 8 outputs in response to incoming MIDI messages of virtually any type.

The MSA has two basic types of operation. At any time, the MSA can be configured for only one of the following:

- **Individual Output Operation:** Each MSA output responds independently to MIDI input.
- **Preset Operation:** The MSA stores up to 128 “presets”, each consisting of an 8-output state. Presets are recalled using program change, CC, or note commands.

To specify the desired behavior for either of the above operation types, the user can employ one of two configuration methods:

- **“Learn” Method:** MSA behavior is specified via a mixture of switch input and MIDI messages.
- **SysEx Method:** MIDI System Exclusive (SysEx) messages are used to specify MSA behavior.

MSA configuration is retained when the MSA is disconnected from a power supply.

The MSA ships with a “factory default” configuration which can be described in terms of equivalent SysEx messages. See [Factory Default Configuration](#).

1.2 About This Document

Throughout this document, SysEx message contents are shown in hexadecimal format. Hexadecimal numbers either are described as “hex” or are followed by the 'h' suffix. Decimal format should be assumed for all other numbers.

1.3 Additional Resources

Instructions for using a PC to create and send SysEx messages can be found at:

<http://highlyliquid.com/support/library/midi-sysex.html>

Support inquiries should be posted at the Highly Liquid support forums. Project examples and other information are posted at the forums:

<http://forum.highlyliquid.com/>

2.0 Individual Output Operation

When the MSA is configured for Individual Output Operation, each MSA output responds independently to a specific MIDI message. Configure the MIDI response of each output via the [Learn Method](#) or [SysEx Method](#).

2.1 Learn Method

A user-supplied “program” (PRGM) switch must be attached to the MSA “PRGM” terminals. If no switch is available, a piece of wire can be used to temporarily connect the terminals. See *MSA Hardware User Manual* for wiring details.

Use the following procedure to configure the MSA:

1. Set the MSA [DIP Switch](#) for the desired MIDI channel.
2. Connect power to the MSA while pressing the PRGM switch.
3. Release the PRGM switch. The activity LED will blink slowly to indicate that the MSA is ready to learn.
4. Send a series of 8 MIDI messages to the MSA MIDI In port. As each message is received, the MSA output being assigned to the message will temporarily activate. Allow each output to deactivate before proceeding with the next message.
5. After the 8th message is received, the configuration is stored. To resume normal operation, disconnect, then reconnect power to the MSA.

Table 2-a shows the MIDI message types that can be learned. A single message type or a mixture of message types can be used. If different output modes are desired, the [SysEx Method](#) method must be used.

Table 2-a: Output Configuration by Message Type

| MIDI Message Type | Resulting Configuration |
|-------------------|---|
| Note | Note Trigger |
| CC | CC On/Off |
| Program Change | Program Change “Match Only” |

If the MSA does not receive 8 qualifying messages, any partially learned configuration will be discarded, and the prior configuration will remain.

The learn method can be repeated as desired to change the MSA configuration. Configuration is retained when the MSA is disconnected from a power supply.

2.2 SysEx Method

Figure 2-1 shows the format of the *Individual Output Configuration SysEx Message*. The message is a string of exactly 34 bytes. The body of the message consists of a Unit ID, a 3-byte configuration for each of the 8 MSA outputs, and a 2-byte pulse length.

Upon success, the MSA activity LED blinks 3 times and Individual Output Operation begins.

Figure 2-1: Individual Output Configuration SysEx Message

| Section | Format (Hex) |
|------------------------|-------------------|
| Fixed Header | F0 00 01 5D 05 01 |
| <u>Unit ID</u> | <i>id</i> |
| Output 0 Configuration | <i>mm d0 d1</i> |
| Output 1 Configuration | <i>mm d0 d1</i> |
| Output 2 Configuration | <i>mm d0 d1</i> |
| Output 3 Configuration | <i>mm d0 d1</i> |
| Output 4 Configuration | <i>mm d0 d1</i> |
| Output 5 Configuration | <i>mm d0 d1</i> |
| Output 6 Configuration | <i>mm d0 d1</i> |
| Output 7 Configuration | <i>mm d0 d1</i> |
| Pulse Length | <i>ph pl</i> |
| Fixed Footer | F7 |

2.2.1 Output Mode (*mm*) and Data (*d0*, *d1*)

Parameter *mm* specifies the output mode for the corresponding MSA output. For “normal” modes, the output is “off” by default and is activated in response to incoming MIDI events. For “inverted” modes, the output is “on” by default with an inverted MIDI response.

The meaning of bytes *d0* and *d1* depend on the value of *mm*.

Output modes are described in [Table 2-b](#).

2.2.2 Pulse Length (*ph*, *pl*)

Certain output modes generate fixed-length output pulses. The length of the output pulse is set “globally” via the values *ph* and *pl*, according to the following formula:

$$\text{pulse length} = ((ph \times 128) + pl + 1) \times 0.5 \text{ ms}$$

The valid range for both *ph* and *pl* is 00h–7Fh. Thus, the maximum configurable pulse length is approximately 8.2 seconds. Actual pulse length is accurate to 0.5 ms of configured value.

Output modes which do not generate fixed-length pulses are not affected by the values *ph* and *pl*.

Table 2-b: Output Modes

| <i>mm</i> (Hex) | | Mode Description | <i>d0</i> Meaning | <i>d1</i> Meaning |
|-----------------|----------|---|-------------------|--------------------|
| Normal | Inverted | | | |
| 00 | 40 | Disabled Output does not respond to MIDI input. | Ignored | Ignored |
| 01 | 41 | Note Trigger Output is “on” for the duration of the corresponding MIDI note with velocity greater than or equal to <i>d1</i> . | Note Number | Velocity Threshold |
| 02 | 42 | Note Trigger – Fixed Length Pulse Matching note on messages with a velocity equal to or greater than <i>d1</i> generate a pulse with length determined by the values of <i>ph</i> and <i>pl</i> . | Note Number | Velocity Threshold |
| 03 | 43 | Note Toggle Output state is toggled & latched upon the receipt of a matching Note On message. | Note Number | Velocity Threshold |
| 08 | 48 | CC On/Off Matching CC messages with a value equal to or greater than <i>d1</i> latch output “on”. Matching CC messages with a value less than <i>d1</i> latch output “off”. | CC Number | Value Threshold |
| 09 | 49 | CC – Fixed Length Pulse Matching CC messages with a value equal to or greater than <i>d1</i> generate a pulse with length determined by the values of <i>ph</i> and <i>pl</i> . | CC Number | Value Threshold |
| 0A | 4A | CC Toggle Output is toggled & latched upon the receipt of matching CC messages with a value equal to or greater than <i>d1</i> . | CC Number | Value Threshold |
| 0B | 4B | CC “Match Only” Output is latched “on” when a matching CC message is received. All other CC messages latch output “off”. | CC Number | Ignored |
| 10 | 50 | Program Change “Match Only” Output is latched “on” when a matching program change message is received. All other program change messages latch output “off”. | Program Number | Ignored |
| 11 | 51 | Program Change – Fixed Length Pulse Matching program change messages generate a pulse with length determined by the values <i>ph</i> and <i>pl</i> . | Program Number | Ignored |
| 18 | 58 | Sync – Run Output is latched “on” by MIDI Start or MIDI Continue messages, and is latched “off” by MIDI Stop messages. | Ignored | Ignored |
| 19 | 59 | Sync – Clock MIDI Clock messages generate pulses with length determined by <i>ph</i> and <i>pl</i> . | Ignored | Ignored |

3.0 Preset Operation

The MSA stores up to 128 “presets”, each consisting of an 8-output state. Presets are recalled using program change, CC, or note commands. Configure the MIDI response of each output via the [Learn Method](#) or [SysEx Method](#).

3.1 Learn Method

A user-supplied “program” (PRGM) switch must be attached to the MSA “PRGM” terminals. If no switch is available, a piece of wire can be used to temporarily connect the terminals. See *MSA Hardware User Manual* for wiring details.

Use the following procedure to configure the MSA:

1. Connect power to the MSA. Allow the activity LED self-test to complete.
2. Press, then release the PRGM switch. The activity LED will blink twice to indicate that the MSA is ready to learn.
3. While learning, the MSA will listen for MIDI Program Change, CC, and Note messages **on all channels**.
4. Send the MSA a MIDI message corresponding to the preset to be learned. The MSA outputs will be updated to reflect the existing preset state.
5. Set DIP switch positions 1-4 to correspond to the desired MSA output states 0-3 for this preset.
6. Press and release the PRGM switch. The MSA will set outputs 0-3 as directed in step 5.
7. Set the DIP switch positions 1-4 to correspond to the desired MSA output states 4-7 for this preset.
8. Press and release the PRGM switch. The MSA will set all outputs as directed in steps 5 and 7, and store the output state to the selected preset.
9. Repeat steps 4-8 as desired.
10. To resume normal operation, disconnect, then reconnect power to the MSA.

Important Notes:

1. During normal operation, the MSA will respond only to MIDI messages on the channel specified by the [DIP Switch](#). Be sure to return the DIP switch to the desired channel setting after the learn procedure.
2. The MSA will remember the message type (Program Change, CC, or Note) used during the learning process. The same message type must be used to recall presets during normal operation.

3.2 SysEx Method

Figure 3-1 shows the format of the *Preset Configuration SysEx Message*. The message consists of a fixed header, Unit ID, and *recall type*, followed by one or more 9-byte preset states.

Upon success, the MSA activity LED blinks 3 times and Preset Operation begins.

Figure 3-1: Preset Configuration SysEx Message

| Section | Format (Hex) |
|-------------------------|-----------------------------------|
| Fixed Header | F0 00 01 5D 05 02 |
| <u>Unit ID</u> | <i>id</i> |
| Recall Type | <i>rr</i> |
| Preset State | <i>nn s0 s1 s2 s3 s4 s5 s6 s7</i> |
| Preset State (Optional) | <i>nn s0 s1 s2 s3 s4 s5 s6 s7</i> |
| Preset State (Optional) | <i>nn s0 s1 s2 s3 s4 s5 s6 s7</i> |
| • • • | • • • |
| Preset State (Optional) | <i>nn s0 s1 s2 s3 s4 s5 s6 s7</i> |
| Fixed Footer | F7 |

3.2.1 Recall Type (*rr*)

Byte *rr* specifies which type of MIDI message will be used to recall the presets during operation. See **Table 3-a**.

Table 3-a: Recall Types

| <i>rr</i> (Hex) | Recall Type |
|-----------------|----------------|
| 01 | Program Change |
| 02 | CC |
| 04 | Note |

3.2.2 Preset State (*nn, s0-s7*)

Byte *nn* specifies the number of the preset defined by the following 8 bytes. *nn* corresponds to the MIDI program, CC, or note number used to recall the preset. The MSA can store up to 128 presets. The valid range for *nn* is 00h-7Fh.

Byte *s0-s7* specify the states of MSA outputs 0-7. For these bytes, a value of 00h sets the output to off, and a value of 01h sets the value to on.

4.0 Factory Default Configuration

By default, the MSA operates in Individual Output Operation. MSA outputs 0-7 respond to MIDI notes 60-67. The default configuration can be described by an Independent Output Configuration SysEx Message as shown in [Figure 4-1](#).

Figure 4-1: Factory Default Configuration SysEx Message

| SysEx Data (Hex) | Meaning |
|-------------------|--|
| F0 00 01 5D 05 01 | Fixed header |
| 00 | Unit ID (00h = All Units) |
| 01 3C 01 | Output 0 configuration |
| 01 3D 01 | Output 1 configuration |
| 01 3E 01 | Output 2 configuration |
| 01 3F 01 | Output 3 configuration |
| 01 40 01 | Output 4 configuration |
| 01 41 01 | Output 5 configuration |
| 01 42 01 | Output 6 configuration |
| 01 43 01 | Output 7 configuration |
| 07 67 | Pulse length: 500ms (Not used by factory default output modes.) |
| F7 | Fixed Footer |

5.0 Configuration Retrieval

5.1 Identity Request / Identity Reply

The MSA responds to the standard “Identity Request” SysEx command. If the MSA receives the SysEx message described in Figure 5-1, it will respond with the standard “Identity Reply” message described in Figure 5-2.

Figure 5-1: Identity Request SysEx Message

| SysEx Data (Hex) | Meaning |
|-------------------|---------------|
| F0 7E 7F 06 01 F7 | Fixed Message |

Figure 5-2: Identity Reply SysEx Message

| SysEx Data (Hex) | Meaning |
|------------------|---|
| F0 7E 7F 06 02 | Fixed Header |
| 00 01 5D | Manufacturer ID |
| 00 00 | Family Code (MIDI Decoder) |
| 00 05 | Model (MSA Rev K) |
| 00 <i>vv</i> | Version, where <i>vv</i> is the firmware version number as described in Table 5-a . |
| <i>id</i> | <u>Unit ID</u> |
| <i>tt</i> | Configured Operation Type. <i>tt</i> = 01h for <u>Individual Output Operation</u> . <i>tt</i> = 02h for <u>Preset Operation</u> . |
| F7 | Fixed Footer |

Table 5-a: Firmware Version

| <i>vv</i> (Hex) | Firmware Version |
|-----------------|-------------------------------|
| 00 | 3.0 |
| 01 thru 7F | Reserved for future versions. |

5.2 Output Configuration Retrieval

The current MSA configuration can be retrieved via the MSA MIDI Out port.

If the MSA receives a SysEx message as described in [Figure 5-3](#), it will send its configuration as an Individual Output Configuration SysEx Message.

If the MSA receives a SysEx message as described in [Figure 5-4](#), it will send its configuration as a Preset Configuration SysEx Message.

Figure 5-3: Individual Output Configuration Request SysEx Message

| SysEx Data (Hex) | Meaning |
|----------------------------|---------------|
| F0 00 01 5D 05 00 00 01 F7 | Fixed Message |

Figure 5-4: Preset Request SysEx Message

| SysEx Data (Hex) | Meaning |
|-------------------------|--------------|
| F0 00 01 5D 05 00 00 02 | Fixed Header |
| <i>pp</i> | Preset # |
| F7 | Fixed Footer |

6.0 DIP Switch

The MSA DIP switch serves two main purposes: to set the MIDI channel for MIDI input, and to set the “Unit ID”. See [Table 6-a](#).

6.1 MIDI Channel

The MSA DIP switch is used to specify the MIDI channel for incoming MIDI messages. During normal operation, the MSA will respond only to messages received on this channel.

6.2 Unit ID

Each configuration SysEx message contains a *Unit ID* byte.

If the Unit ID byte is 00h, any MSA unit receiving the message will configure itself as directed by the message.

If the Unit ID byte is between 1 and 16 (01h to 10h), any MSA receiving the message will update its configuration only if its DIP Switch setting matches the Unit ID. This allows the user to target & configure a single MSA within a chain of multiple units.

Table 6-a: MIDI Channel / Unit ID DIP Switch Settings

| MIDI Channel / Unit ID | SW1 Setting | | | |
|------------------------------|-------------|-----------|-----------|-----------|
| | 1 | 2 | 3 | 4 |
| 1 | off | off | off | off |
| 2 | off | off | off | on |
| 3 | off | off | on | off |
| 4 | off | off | on | on |
| 5 | off | on | off | off |
| 6 | off | on | off | on |
| 7 | off | on | on | off |
| 8 | off | on | on | on |
| 9 | on | off | off | off |
| 10 | on | off | off | on |
| 11 | on | off | on | off |
| 12 | on | off | on | on |
| 13 | on | on | off | off |
| 14 | on | on | off | on |
| 15 | on | on | on | off |
| 16 | on | on | on | on |

7.0 Activity LED

The MSA activity LED performs several functions:

- **Self Test:** Upon power-up or device reset, the activity LED lights briefly before normal operation begins.
- **Configuration Update Indication:** When the MSA configuration is updated via a MIDI SysEx message, the MSA will reset, followed by the LED self-test. If no LED activity is observed, then the attempted configuration was unsuccessful.
- **MIDI Activity Indication:** The LED blinks when a MIDI message is received that affects the MSA output state. Other MIDI messages will not cause an activity indication.
- **Learn Mode Indication:** The LED will blink slowly while the MSA awaits MIDI messages during Learn Mode.
- **Firmware Update Error:** The LED blinks continuously when the receipt of a firmware update SysEx message has failed, or when the firmware has become corrupt.

8.0 Firmware Update

MSA firmware can be upgraded via MIDI SysEx message. Firmware update files, when available, can be downloaded from the MSA product page at highlyliquid.com.

8.1 Firmware Update Procedure

1. Download and unzip the firmware update SysEx message. The resulting file should have the extension “.syx”.
2. Disconnect power to the MSA.
3. Press and hold the PRGM switch. (See *MSA Hardware User Manual*.)
4. Reconnect power to the MSA. The activity LED will remain lighted.
5. Send the firmware update SysEx message to the MSA. Transmission of the message may require several seconds.
6. Upon completion of the update, the activity LED will deactivate.
7. Release the PRGM switch.
8. Disconnect power to the MSA.

8.2 Notes

- Do not interrupt the transmission of the firmware update SysEx message.
- A continuously blinking activity LED indicates an error in the transmission of the firmware update SysEx message.
- If a continuously blinking activity LED is observed, repeat the procedure from the beginning.
- The current firmware version can be retrieved via Identity Request / Identity Reply SysEx messages.
